

Customer Service Insights Copilot

Every step, start to finish, including the current (2026) way to build the tool in Step 6 — an agent flow combining a Dynamics 365 update with a Teams adaptive card.

i

What You're Building

An agent that lets agents triage and escalate cases in conversation, while giving managers real-time SLA/CSAT visibility, grounded in one data file, acting through one governed tool.

AGENT NAME	Customer Service Insights Copilot
ORCHESTRATION	Generative (AI-led)
KNOWLEDGE	Customer_Service_Cases_Data.xlsx
CUSTOM TOPIC	Escalate Case
TOOL	Escalate Case (agent flow → Dynamics 365 + Teams)

Files & Where They Go

FILE / ITEM	GOES TO	USED IN
Customer_Service_Cases_Data.xlsx	Copilot Studio → Knowledge tab → Add knowledge → File	Step 3

No new list needs creating — this flow updates your existing Dynamics 365 **incident** table.

Before you start — confirm you have Environment Maker permission, and that your Dynamics 365 Customer Service environment's **incident** table is available to the flow connection.

Set Up the Agent

Steps 1–3 — create the agent shell, pick how it reasons, and ground it in data.

1 Create Your Copilot Studio Agent

Open Copilot Studio (copilotstudio.microsoft.com), select **Create** → **New agent**, then configure:

AGENT NAME	Customer Service Insights Copilot
DESCRIPTION	Agents triage cases and escalate intelligently; managers monitor SLA, CSAT, and escalation patterns in real time.
SOLUTION / ENVIRONMENT	Customer Service Solution · Default environment
ICON	Use a recognisable colour and emoji or upload a brand icon

2 Choose Orchestration Mode

Under **Settings** → **Generative AI**, use **Generative Orchestration** (AI-led) so the agent can blend knowledge lookups with tool calls for customer service operations.

3 Add Knowledge

Knowledge tab → **Add knowledge** → **File** → upload **Customer_Service_Cases_Data.xlsx**. Contains:

- Case details (case ID, customer, region, product, issue type, channel)
- Operational data (priority, status, assigned agent, escalation flag)
- Time data (opened, resolved, first response, resolution time)
- Outcome data (SLA Met, CSAT score 1-5)

You can layer additional sources later — SharePoint sites, Dataverse, public web, or Graph connectors.

Behavior: Instructions & Topic

Steps 4–5 — tell the agent how to behave, then give it a reusable conversation flow.

4 Add Agent Instructions

Overview → Instructions — paste exactly:

You are the Customer Service Insights Copilot. You help two audiences:

- 1) Customer service agents working their queue.
- 2) Service managers monitoring SLA, CSAT, and escalations.

Rules:

- Use the uploaded case data as your single source of truth.
- For analytical questions, calculate from rows and show your working.
- For escalations, call the 'Escalate Case' tool – never just say 'escalated'.
- Always show case ID, customer, priority, and SLA status in answers.
- Treat customer data with care: never expose another customer's data.

5 Add a Custom Topic

Topics → Add a topic → Create from description:

Topic name: Escalate Case

Description: Lets an agent escalate a case to a manager with a structured reason, updating Dynamics 365 and notifying the on-call manager.

Trigger phrases:

- Escalate case CS4007
- I need to escalate this
- Send this to a manager
- This case is urgent

Conversation steps:

- Identify the case ID (confirm if ambiguous)
- Show the current priority, status, and SLA status from knowledge
- Ask for an escalation reason (Customer impact / Tech blocker / Other)
- Call the 'Escalate Case' tool to update D365 and notify the manager
- Confirm the new owner and expected response window

Build the Tool (Current Method)

Step 6 — updated for 2026, using current Copilot Studio tool-building.

6a Build the Agent Flow

1. **Flows** → **New flow** → **Agent flow** (starter template includes the required **When an agent calls the flow** trigger and **Respond to the agent** action) — or describe it in one prompt via the natural-language chat panel.
2. Add trigger inputs: **CaseID**, **EscalationReason**, **Context**, **SuggestedPriority**.
3. Add action: **Dynamics 365** — **Update a row** → table **incident** → set priority and escalation flag fields.
4. Add action: **Office 365 Users** — **Get manager (V2)**, or resolve the on-call manager from a fixed distribution list if that fits your support model better.
5. Add action: **Teams** — **Post your own adaptive card as the Flow bot to a user/channel** → Recipient = the on-call manager → include CaseID, priority, and Context in the card.
6. On **Respond to the agent**, add outputs **NewOwner** and **ExpectedResponseWindow**. Confirm **Asynchronous response** = **Off**.
7. **Publish** the flow.

6b Attach It as a Tool

1. **Tools** → **Add a tool** → filter by **Flow** → select your published flow → **Add and configure**.
2. **Name**: Escalate Case. **Description**: "Sets escalation flag, raises priority if needed, notifies the on-call manager."
3. Under **Inputs**, leave all four for the agent to collect from conversation.
4. Under **Completion**, respond using the returned **NewOwner** and **ExpectedResponseWindow**.
5. **Save**.

Original spec, for reference — Tool: Escalate Case. Type: Dynamics 365 connector (Update record on 'incident' + Teams adaptive card). Sets escalation flag, raises priority if needed, notifies the on-call manager. Inputs: Case ID (string); Escalation reason (Customer impact / Tech blocker / Other); Free-text context (string); Suggested new priority (P1 / P2). Outcome: Returns the updated case owner and posts an adaptive card to the team channel.

Configure, Evaluate, Test, Publish

Steps 7–10 — lock down settings, prove quality, and ship it.

7 Configure Settings

Settings cog (top right) — four areas before real users touch the agent:

- **General** — confirm name, description, primary language
- **Generative AI** — orchestration mode, content moderation (start at Medium)
- **Authentication** — "Authenticate with Microsoft" so the agent runs as the signed-in user
- **Security** — review DLP policy, enabled channels, end-user authentication

8 Evaluate Your Agent

Analytics → **Evaluations** → **New evaluation** — "Customer Service Copilot — Baseline v1". Score every response on Groundedness, Relevance, Accuracy.

Input: Show me all escalated cases with customer and agent
Expect: Returns rows where Escalated = Yes, including required columns.

Input: What's the SLA Met rate by priority?
Expect: Calculates percentage of SLA Met = Yes per priority and ranks them.

Input: Escalate CS4007 – customer impact is high
Expect: Triggers the Escalate Case topic end-to-end and updates D365.

9 Test in the Test Pane

For each query, open **Activity map** to see: which topic/tool/knowledge fired, the inputs collected and outputs returned, citations to source rows, and per-step latency.

10 Publish to a Channel

Publish (top right) → **Channels**: Microsoft Teams (needs admin approval), Microsoft 365 Copilot, custom web embed, or Slack/Facebook/Telephony. Admin approval will not land inside a short workshop — the Test pane is your real finish line on the day.

Try These Live

Sample queries to run once the agent is built — and what it replaces.

Queue & Triage

- Show me all cases currently Escalated.
- Which agent has the most open cases by priority mix?

Experience & SLA

- What is the average first response time by priority?
- Which customers have given a CSAT score below 3 — and why?

Governed Action

- Escalate CS4012 with reason 'Customer impact — major outage'.
- List cases I escalated this week to verify the audit trail.

This agent replaces

- Manual queue triage in case management
- Side-conversations to chase escalation approvals
- Weekly QBR data pulls and copy-paste decks

With

- Triage and escalation in a single conversational flow
- Structured escalation reasons feeding QBR data
- Real-time visibility into SLA and CSAT signals

Tip for real-world use — use Dynamics 365 business unit security on the agent so each region sees only its own cases. Add an Evaluation set that mimics your top 20 most-common customer questions.
